

Clinical applications for spiral flow imaging – Part II

Joao L. A. Carvalho

Department of Electrical Engineering, University of Southern California

MR flow quantitation

- Phase contrast ^{O'Donnell, 1985}
 - Fast
 - One velocity estimate for each voxel
- Fourier velocity encoding (FVE) ^{Moran, 1982}
 - Slow
 - Velocity distribution in each voxel

Techniques and applications

1. Spiral FVE
 - Carotid wall-shear stress
2. Spiral phase-contrast
 - Stroke volume variability

Techniques and applications

1. **Spiral FVE**
 - **Carotid wall-shear stress**
2. Spiral phase-contrast
 - Stroke volume variability

Motivation

Carotid Atherosclerosis

Wall-shear stress

$$WSS = \mu \frac{dv}{dr}$$

blood viscosity spatial variation of blood velocity

Plaque ↔ high WSS ^{Thubrikar, 1995}

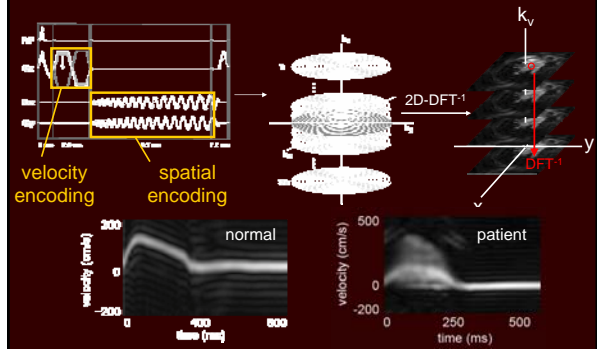

No non-invasive gold standard

Measuring dv and dr

- “dv” is measured with flow encoding
- Problem: “dr” is sub-millimeter
 - Phase contrast
 - partial volume
- FVE
 - Needs 2D spatial localization
 - Prohibitively slow
- We propose using Spiral FVE

Spiral FVE

Spiral FVE - Validation

- Validation against hi-res phase contrast
- Pulsatile flow phantom
- PC-derived FVE
 - Sinc blurring along v
 - Jinc blurring along x,y

$$\begin{matrix} \text{PC} & & \text{FVE} \\ m(x,y) & \xrightarrow{\text{sinc}(v)} & s(x,y,v) \\ v(x,y) & \xrightarrow{\text{jinc}(x,y)} & \end{matrix}$$

Spiral FVE - Validation

Carotid flow waveforms

Flow distributions

Frayne method

- Models $v(r)$ from $s(v)$

Shear rate numerical phantom

velocity map

shear rate map

Simulation results

Resolution requirements

| | | Spatial resolution (mm) | | | | | | |
|----------------------|-----|-------------------------|-------|-------|-------|-------|-------|--------|
| | | 7 | 5 | 4 | 3 | 2 | 1.5 | 1 |
| Velocity res. (cm/s) | 60 | 53±15 | 37±19 | 30±14 | 27±19 | 53±45 | 99±61 | 191±91 |
| | 30 | 58±14 | 45±18 | 35±17 | 26±12 | 25±23 | 47±38 | 105±56 |
| | 20 | 52±19 | 40±15 | 33±13 | 24±10 | 16±14 | 26±20 | 62±37 |
| | 15 | 38±16 | 32±18 | 25±16 | 17±11 | 18±12 | 20±24 | 47±39 |
| | 10 | 34±16 | 28±13 | 22±12 | 15±10 | 22±22 | 17±18 | 41±41 |
| | 7.5 | 33±16 | 28±13 | 22±12 | 16±10 | 22±23 | 17±18 | 40±45 |
| | 5 | 34±16 | 28±13 | 22±12 | 16±10 | 23±25 | 17±18 | 42±49 |
| | 3.8 | 34±16 | 28±13 | 22±12 | 15±10 | 24±28 | 17±18 | 44±51 |

Optimal spatial resolution

- Depends on width of viscous sublayer (δ_r)

Spatially varying resolution

- Use high resolution
- Retrospectively blur certain regions

Off-resonance simulation

In vivo demonstration

Techniques and applications

1. Spiral FVE
 - Carotid wall-shear stress
2. *Spiral phase-contrast*
 - *Stroke volume variability*

Stroke volume

- Volume ejected by LV per heartbeat
- Applications: ischemia, valve disease, hypertension, lung disease
- Stroke Volume Variability (SVV):
 - indicator of sympathetic response
 - connects heart rate variability (HRV) to blood pressure and venous return variabilities

No non-invasive gold standard!

Recent methods in MRI

- Averaged through several heartbeats
- Can measure cardiac output only

- We propose measuring beat-to-beat SV

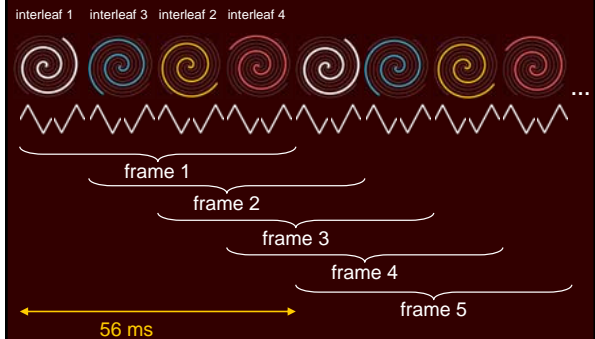

Scan parameters

- Variable-density spiral phase contrast
 - Interleaves: 4
 - Resolution: **3 mm**
 - FOV: 25–6 cm
 - Venc: 200 cm/s
 - Temporal resolution: **56 ms**

Pulse sequence

View ordering

Assumptions

- Partial volume:
 - PC velocity = average velocity within the voxel
 - Flow in voxel = voxel size x PC velocity
- Variable density spiral: aliasing artifacts are insignificant within the ROI

Slice prescription

- Perpendicular to aorta
- Before main bifurcations

ROI following

- Velocity and magnitude thresholds
- Recalculated every heartbeat

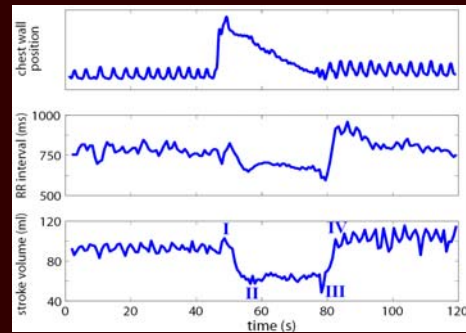

Stroke volume calculation

Stimuli

- Valsalva maneuver
- Handgrip
- Facial cooling
- Mental stress
- Cold pressor

Results – Valsalva maneuver

Handgrip & facial cooling

Mental stress & cold pressor

Conclusion

- We can't validate the technique non-invasively
- The results are in agreement with our expectations based on our current understanding of the physiology

The End
